```
New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                               invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            法法
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                         This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West Nile virus with humans and horses serving as incidental hosts. Infection of humans can lead to maningitis or encephalitis. The

                                                                                                                                                                                                                                         invention may allow for accurate and efficient high throughput screening.
The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel method for analysing a target nucleic acid sequence in a biological material. The method comprises adding at least two nucleic acid primers that hybridise under stringent conditions to predetermined nucleic acid sequences of the target nucleic acid sequences that are separated by at least 750 nucleic acid residues, amplifying the target nucleic acid sequence by PCR, and detecting and quantifying the target nucleic acid sequence. The methods and compositions of the present invention are useful for analysing a target nucleic acid sequence in a biological material by real time PCR using nucleic acid grimers that are separated by at least 750 nucleic acid residues in the target sequence. This polynucleotide sequence represents the genomic DNA of a West Nile virus used in the target analysis method
                             This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The
                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                   48
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       48
                                                                                                                                                                                                                                                                                                                                                                  Length 70;

of the invention.

```
The invention relates to a method of determining (MI) level of potentially active biological pathogens in biological material, involves adding at least two nucleic acid primer pairs to biological material, and defecting and adding at least two nucleic acid sequences by PCR, and defecting and quantifying target nucleic acid sequences by PCR, and defecting and caid sequences is proportional to number of biological pathogens in biological material. (MI) is useful for determining level of potentially active biological pathogens in a biological material such as cells, tissues, blood or blood components, proteins, enzymes, immunoglobulins, botanicals, food, ilgaments, tendons, nerves, bone, teeth, skin grafts, companied or animal remains, stem cells, islet carbohydrates, catilage, corneas, arteries, veins, organs, lipids, carbohydrates, collagen, chitin and its derivatives, forensic samples, munmified material, human or animal remains, stem cells, islet of Langerhans cells, cells for transplantation, red blood cells, white blood cells or platelets. The biological pathogen is chosen from bacteria, viruses, fundi and single cell parasites. The biological pathogen is chosen from Aspergillus, Cangylobacter, Helicobacter, Listeria, Clampylobacter, Helicobacter, Listeria, Clampylobacter, Helicobacter, Listeria, Clampylobacter, Corpubacterium and Coxiella, Clampylobacter, Listeria, Corpubacterium and Coxiella, Clampylobacter, Belacterium and Coxiella, Clampylobacter, Corpubacter, Belacterium and Coxiella, Clampylobacter, Corpubacter, Listeria, Clampylobacter, Corpubacter, Belacterium and Coxiella, Clampylobacter, Corpubacter, Menonia, Corpubacter, Menon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining level of potentially active biological pathogens in
biological material, by adding nucleic acid primer pairs to biological
material, amplifying target nucleic acid by PCR, detecting and

CC Hantavirus, Hepatitis A virus (HAV), Hepatitis C virus (HCV), Hepatitis G delta virus (HDV), Hepatitis E virus (HEV), Hepatitis G virus (HGV), HIV, Human Tlymphotrophic virus (HTLV), Influenza virus (HL virus), Meaales virus (Rubeola), Mumps virus, Norwalk virus, Parainfluenza virus, Polio virus, Rabies virus, Respiratory Syncytial virus, Rhinovirus, Rubella virus, Rabies virus, Adenovirus, Western equine encephalitis virus (WEV), Saint Louis encephalitis virus (WEV), Yellow fever virus, Adenovirus, Cytomegalovirus (CWV), Epstein-CC Sarr virus (EBV), Hepatitis B virus (HBV), Herpes simplex virus 1, Herpes CC Simplex virus (WEV), Smallpox virus (VEV), Ebola virus, West Nile virus, Human Parrovirus (HBV), Smallpox virus (VEV), Ebola virus, West Nile virus, Human Parrovirus B19 and Rotavirus (MI) is useful for determining the effectiveness of a sterilization of process applied to a biological material (MI) is useful in determining whether the biological pathogen is inactive or active. (MI) enables determination of whether the particular biological pathogen is inactive or active. (MI) enables and biological material as shown by amplification of first target sequence and whether the biological pathogen is inactive or active. (MI) enables caralustion of the effectiveness of sterilization processes, and determination of both the original level and the residual level of potentially active biological pathogens. This sequence corresponds to a West Nile virus DNA detected by the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New diagnostic kit comprising West Nile Virus (WNV) envelope protein reactive with antibody against WNV and cross-reactive with antibody against a flavivirus, useful in diagnosing flavivirus infection caused by

This strain is a neuroinvasive and encorvivalent strain of WNV. Polymucleotides and polypeptides derived from the 15-98-5T1 genome are useful for diagnosis and prognosis of Plavivirus infection, specifically WNV-mediated encephalitis. They are also useful to raise specific antibodies, for recombinant expression of WNV proteins or peptides (for diagnosis, production of antibodies and identification of specific binding partners in cells), for identifying cellular genes implicated in resistance to viral infection, and for screening for anti-Flavivirus agents
                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New neurovirulent strain of West Nile virus, useful in diagnosis and screening for antiviral agents, also related nucleic acids, proteins and
envelope (E) protein or its immunogenic fragment having a native conformation or non-denatured structure and that is reactive with antibodies against antibodies against a flavivirus. The diagnostic kir is useful in diagnosing flavivirus infection caused by DENV, WNV, JEV or SLEV. This sequence corresponds the complete nucleotide sequence of the WNV isolate 2741.
                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Deubel V, Guenet J, Drouet M, Malkinson M, Banet Courageot M, Coulibaly F, Catteau A, Flamand M,

The present invention relates to a method for identifying compounds (I) that can stimulate a gene of the OAS (2'-5'-oligoadenylate synthase) (family. The method comprises: (a) inducing expression of the OAS gene in a culture of cells from a non-human mammal (Flvr/Flvr or Flvr/Flvs; indicating resistance or sensitivity to Flavivirus infection); (b) treating cells with test compound; and (c) measuring activity of OAS gene treating infections by Flaviviruses (e.g. hepatitis C; dengue; yellow fever and various forms of encephalitis). Genomic OAS DNA and derived control. (I) are potentially useful as antiviral agents for treating infections by Flaviviruses (e.g. hepatitis C; dengue; yellow fever and various forms of encephalitis). Genomic OAS DNA and derived completing, are useful: (a) for treating Flavivirus infection; (b) in screening for anti-flavivirus agents, and (c) for evaluating sensitivity of subjects to Flavivirus infection and their crisk of developing severe forms of such infections. The present sequence is weet Nile Virus strain NY99-flanding 382-99 (IS-98-STI) complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying stimulators of oligoadenylate synthase family genes, useful as antiviral agents against Flavivirus, also mutated genes responsible for sensitivity to virus.

This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
West Nile virus detection-related oligonucleotide probe SeqID101
                                                                                    hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; RNA virus; infection; meningitis; encephalitis; high throughput screening; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; RNA virus; infection; meningitis; encephalitis; high throughput screening; probe; ss.

```
This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to emenigities or encephalities. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                        New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hybridisation assay probe; nucleic acid detection; target-complementary sequence; flavivirus; West Nile virus; WNV; RNA virus; infection; meningitis; encephalitis; high throughput screening; probe; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West Nile virus is a RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening.
                                                                                                                                                                                                                                                                                                                                                                                      New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                         New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                        invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                      This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The

                                                                                                         The present invention relates to a method for screening for a flavivirus in a subject or animal host. The method comprises: contacting a sample from the subject with a composition comprising a flavivirus envelope protein domain III polypeptide (ADK13683-ADK13701) under conditions that permit formation of specific immunocomplex between an antibody in the sample and the envelope protein domain III polypeptide; and detecting whether a specific immunocomplex is formed. The present sequence is the coding sequence for West Nile Virus protein, from which E protein envelope protein domain III polypeptide (ADK13683) is derived.
animal with a flavivirus envelope protein domain III polypeptide, and detecting formation of a immunocomplex between the envelope protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          note= "OTHER= 2'-methoxyethoxy (2'-MOE) nucleotides"

ô
detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in electering and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detected. The hybridisation assay probes and the kits are useful in flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (MNN) is an RNN virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening The present sequence is that of a PCR primer which is related to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.

New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                          This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus is an RNA virus that primarily infects
                                                                                                                                                                                                                                                                                                                                                                                                                                                         birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The

The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV cDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                          New Japanese encephalitis virus genomic RNA, useful in developing vaccines for and in diagnosing and treating Japanese encephalitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a

```
ö
The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a S' and 3' nontranalated region (WTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.

The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA,
                                                                                                                                                                                                                                                                                                                           The present invention relates to a genomic RNA of the Korean Japanese Encephalitis Virus (JEV) isolate, composed of a 5' and 3' nontranslated region (NTR) and a single polypeptide coding region. The JEV genomic RNA, JEV CDNA and reagents are useful in developing vaccines for and in diagnosing and treating Japanese encephalitis. The present sequence is a sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                           New Japanese encephalitis virus genomic RNA, useful in developing vaccines for and in diagnosing and treating Japanese encephalitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects blids and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                              /note= "OTHER= 2'-methoxyethoxy (2'-MOE) nucleotides"

```

```
New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hosts. Infection of humans can lead to meningitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to meningitis or encephalitis. The
                                                                                                                                                                                                                                                                                      1. .19

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel hybridisation assay probe, for detecting a nucleic acid, which is a probe sequence that comprises a target-complementary sequence of bases, and optionally one or more base sequences that are not complementary to the nucleic acid that is to be detected. The hybridisation assay probes and the kits are useful in detecting and amplifying a target nucleic acid sequence, for example flavivirus like West Nile virus, that may be present in a biological sample. West Nile virus, that may be present in a biological sample. West nile virus (WNV) is an RNA virus that primarily infects birds and culex mosquitos, with humans and horses serving as incidental hosts. Infection of humans can lead to menigitis or encephalitis. The invention may allow for accurate and efficient high throughput screening. The present sequence is that of an oligonucleotide probe which is related
                                                                                                                                                                                                                                                                                                                 New hybridization assay probe comprising target-complementary sequence of bases, useful in detecting flavivirus, e.g. West Nile virus.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, invocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-Cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; infection; hepatitis; lifert failure; cancer; Cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         35.4%; Score 17; DB 6; Length 17; 100.0%; Pred. The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (MNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, mocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                            New nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WAV, West Nile Virus, antiinflammatory, cytostatic, hepatotropic, virucide, neuroprotective; antibacterial; replication; pancreatitis, encephalitis; myocarditis; meningitis; infection, hepatitis; liver failure, cancer, cirrhosis; Hammerhead, Inozyme, DNAzyme;
                                                                                                                                   (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encaphalitis, mentalitis, mentalitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme, and Zinzyme. The nucleic acid molecules further comprises at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules EEQ ID No 194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                            ਨੇ
                                                            of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, treating a condition related to WNV infection e.g. pancreatitis, menigitis, menigitis, neurologic infection, hepatitis, underlained to word arctinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleocides and a 3' end modification of a 3'-3' innverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
                                                 invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to MNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                Gaps

molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed; however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encophalitis, wnyocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleoides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for Eneating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme, and Zinzyme. The nucleic acid molecules further comprises at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules EEQ ID No 1 to 37080 are claimed; however, SEQ ID No 2194-2206 and 17502-17514 are not given molecules.
are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                           WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid molecule that modulates replication of West Nile Vir
(WNV), useful for treating a condition related to WNV infection e.g.
pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myozacaditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme, and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least there of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 119-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatits, meningitis, hepatocellular carcinoma or cirrhosis.

```
The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis; invection related to WNV infection e.g. pancreatis; liver failure, hepatocallular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' and modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                WMV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatotis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           35.4%; Score 17; DB 6; Length 17; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

```
The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encaphalitis, myozaciditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DMAZyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID No 1 to 37080 are claimed, however, SEQ ID No 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WNV, West Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      35.4%; Score 17; DB 6; Length 17; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme, and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNASyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least tive ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
   nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; cirrhosis; Hammerhead; Inozyme; DNAzyme;
                   (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WNV; West Nile Virus; antiinflammatory; cytostatic; hepatotropic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                      of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                         invention relates to nucleic acid molecules that modulate replication
                                                                                                                 New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

treating a condition related to MNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid

                                                                                                                                                                                                                                                                                                                                                                           d
```

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WVV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, not failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at

least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, wyocarditis, meningitis, neurologic infection, hepatitis, notation is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNZzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least than 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleocides and a 3' end modification of a reclaimed; however, SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to MNV infection e.g. pancreatitis, encaphalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

                                              The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, words and a condition related to WNV infection e.g. pancreatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinsyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5 terminal nucleotides and a 3 end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
